

Civils

General

Many projects we become involved with have aspects of specialist Civil Engineering works.

We have developed expertise in many areas including drainage design, which often requires alternative solutions or the use of SUDS techniques. Our projects often require specialist retaining and foundation systems, or ground stabilisation and improvement techniques.

In recent years environmental concerns have seen many sites needing remediation to address ground contamination and we have worked closely with the Environmental Engineers and agencies as well as specialist contractors to clean up many sites for re-use.

In the area of highways and transport many estate roads, site accesses and improvement work schemes have been completed often with statutory agreements being negotiated.

This area of our work is diverse and specialist and crosses all sectors.
