The Somerfield Hospital, Maidstone, Kent

This project involved the refurbishment of areas of the existing hospital and the provision of a new ultra-clean operating theatre suite with associated rooms in a self-contained single storey modular building located within an internal paved courtyard of the main hospital.

Peter Dann were responsible for the design of foundations to support the new modular theatre, including below ground drainage modifications and design of the new structural through openings from the existing building.

We also undertook the design of the structural steelwork platforms for new external new modular plant room and air conditioning units over the roof of the existing single storey building.

The interior refurbishment works within the existing ground floor of the hospital to provide an extended recovery area and the reconfiguration of a theatre suite.
